Subject/Note: Stopping AI-assisted technical hires

Hi [Name],

A growing problem I am hearing from [CTOs / TA Leaders] is candidates using real-time AI or proxies during remote technical interviews. The cost of missing this until after onboarding is massive — often €100k+ in runway, comp, and technical debt.

I built Certalytic to catch this. It is a decision-support integrity layer that cross-references a candidate's CV against their interview transcripts and [LinkedIn/GitHub] signals to flag inconsistencies — plus behaviour and personality insights for your hiring committee (kept separate from the integrity score).

The workflow is simple: create a role, paste up to three interview transcripts per finalist, and export a watermarked PDF dossier. It takes minutes for your team to run on your final 5-10 candidates, and all data is processed strictly on EU infrastructure (Hetzner/Mistral) so there is zero GDPR compliance risk with US AI models.

Plans start at **€159/mo for 20 screenings** (Growth at €349/50, Scale at €799/125). Three free screenings to try it.

Worth a quick look to see how it works?
